```

Upon brief visual look, there might be some correlation. We will set up for our model by using the Dickey-Fuller test and ACF (Autocorrelation) and PACF (Partial-autocorrelation)

# **Checking for Stationarity**

```
In [196]:
          dftest = adfuller(df.y)
          dfoutput = pd.Series(dftest[0:4], index=['Test Statistic','p-value','#Lags Used'
          for key,value in dftest[4].items():
              dfoutput['Critical Value (%s)'%key] = value
          print(dftest)
          print()
          print(dfoutput)
          (0.4264058900663843, 0.9824560176613198, 15, 249, {'1%': -3.4568881317725864,
           '5%': -2.8732185133016057, '10%': -2.5729936189738876}, 3685.7722463752716)
          Test Statistic
                                           0.426406
          p-value
                                           0.982456
          #Lags Used
                                          15.000000
          Number of Observations Used 249.000000
          Critical Value (1%)
                                          -3.456888
          Critical Value (5%)
                                          -2.873219
          Critical Value (10%)
                                          -2.572994
          dtype: float64
```

#### **Dickey Fuller Test**

- We see that test statistic value is -1.052638
- We see that the critical values are LESS than the test statistic. (-3. 45, -2.87, -2.57)
- From just the baseline data, the test statistic I have is MORE than the critical value.
- We accept the null that the time series is not stationary!

#### P-Value analysis

- 1. If p-value > 0.05: Fail to reject the null hypothesis (H0), the data has a unit root and is non-stationary.
  - Our current p-value is 0.733585
    - This means: p-value > 0.05: Fail to reject the null hypothesis (H0), the data has a unit root and is non-stationary.
- 2. If p-value <= 0.05: Reject the null hypothesis (H0), the data does not have a unit root and is stationary.
  - · Our goal is to make the data stationary

#### **Auto-Correlation and Partial Auto-Correlation Check**

```
In [198]:
            #ACF using plotting
            plt.figure(figsize=(20, 5))
            pd.plotting.autocorrelation_plot(df['y']);
            #Statsmodels ACF
            rcParams['figure.figsize'] = 20, 5
            plot_acf(df['y'], lags=125, alpha=0.05);
               0.00
              -0.75
                                                         Autocorrelation
             1.00
             0.75
             0.50
             0.25
             -0.25
             -0.50
```

#### **PACF**

```
In [199]: pacf(df['y'], nlags=20)
    rcParams['figure.figsize'] = 20, 5
    plot_pacf(df['y'], lags=50, alpha=0.05);
Partial Autocorrelation

Partial Autocorrelation
```

# **Observations of ACF and PACF**

# We see the following:

 We know that the ACF describes the autocorrelation between an observation and another observation at a prior time step that includes direct and indirect dependence information.

- After about 18 lags, the line goes into our confidence interval (light blue area).
- This can be due to seasonality of every 18 months in our data.
- We know that the PACF only describes the direct relationship between an observation and its lag.
  - PACF cuts off after lags = 2
  - This means there are no correlations for lags beyond 2

# \*\* Granted the data is not stationary, we will have to transform the data to make it stationary and satisfy the Dicky-Fuller test\*\*

# De-trending and transforming the data

1. I will try the following

12.3

12.2

12.1

2004

2009

- · Log transform
- · Subtract rolling mean
- Run Dickey-Fuller test with each transform to see if I can rejefct/accept the null hypothesis
- Null-Hypothesis for Dickey-Fuller test is: The null-hypothesis for the test is that the time series is not stationary. So if the test statistic is less than the critical value, we reject the null hypothesis and say that the series is stationary.

          dtype: float64
```

#### --- Observations of Dickey-Fuller Test ---

- We see Test Statistic is less than the Critical values, this satisfies the stationarity assumption. We can reject the null and say series is stationary.

```
- Test Statistic -4.428505

- Critical Value (1%) -3.458247

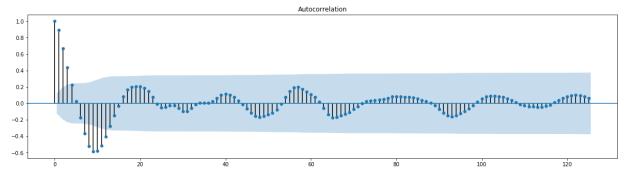

- Critical Value (5%) -2.873814

- Critical Value (10%) -2.573311
```

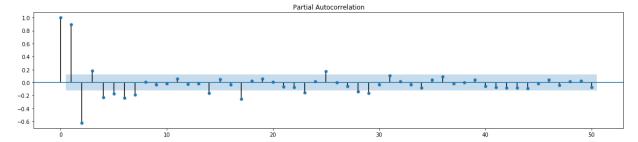

- We see that p-value = 0.000264. Since p <= 0.05, I can reject the null hypothesis (H0 = series is non-stationary). The data does not have a unit root and is stationary.

#### **ACF and PACF**

```
In [210]: #StatsmodeLs ACF
    rcParams['figure.figsize'] = 20, 5
    plot_acf(logged_df_diff_roll_mean1, lags=125, alpha=0.05);
```

```
In [211]: #PACF plot
    rcParams['figure.figsize'] = 20, 4
    plot_pacf(logged_df_diff_roll_mean1, lags=50, alpha=0.05);
```

#### --- Observations of ACF and PACF ---

- 1. After about 4 lags, the line goes into our confidence interval (light blue area).
  - This can be due to seasonality of every 4 months in our data.
- 2. PACF trails off after 2-3 lags.
  - · Also slight slight sinusoidal behavior but nothing crazy
  - This means there are no high correlations for lags beyond 2-3
- 3. Based on above information and that the data is stationary, we can use the p and q values for the ARMA model
  - p = 4 (per ACF)
  - q = 2 (per PACF)

# **ARMA Modeling**

```
In [212]: # Instantiate & fit model with statsmodels
          \#p = num \ Lags - ACF
          p = 4
           # q = lagged forecast errors - PACF
          q = 2
          # Fitting ARMA model and summary
          ar = ARMA(logged_df_minus_roll_mean1,(p, q)).fit()
          ar.summary()
```

Out[213]: 0.9938783610466092

- Ths means that 99.2 percent of the variation in the y data is due to variation in the x data
- This might indicate overfitting, but we chose our params from a stationary time series ACF and PACF.

-Future work: investigate more tweaks to the model

Change the params, maybe it will affect r^2

```
In [215]: # Try p = 4 and q = 3

# Instantiate & fit model with statsmodels
#p = num lags - ACF
p = 4

# q = lagged forecast errors - PACF
q = 3

# Fitting ARMA model and summary
ar = ARMA(logged_df_minus_roll_mean1,(p, q)).fit()
ar.summary()
